SUMMARY

Data scientist who turns messy operational records into models people actually trust and act on. I enjoy the unglamorous parts as much as the modelling: framing the question, cleaning the inputs, and explaining the trade-offs to non-technical stakeholders. Most of my work has sat close to product and operations teams, where a clear answer matters more than a clever one.

EXPERIENCE

Data Scientist — Marlowe Quay Analytics Mar 2024 - Present
Leeds, UK

Lead the modelling track for the customer retention squad, owning everything from feature design to the dashboards leaders check each morning. I rebuilt our churn scoring pipeline so it retrains on a schedule and flags drift before it reaches the business. I also mentor two junior analysts and run the weekly review where we sanity-check model behaviour against real outcomes.

Data Scientist — Hartwell Loop Data Studio Jun 2022 - Feb 2024
Manchester, United Kingdom

Built demand-forecasting and segmentation models for a portfolio of retail and logistics clients. I worked directly with each client to scope the problem, then delivered models packaged with plain-language documentation so their own teams could maintain them. A recurring win was replacing spreadsheet guesswork with forecasts the planners genuinely relied on.

Junior Data Scientist — Pennington Drift Insights Jun 2021 - Jun 2022
Sheffield, England

Supported the senior modelling team on experimentation and reporting for a subscription business. I owned the A/B test analysis backlog and wrote the reusable scripts that turned raw event logs into clean cohort tables. This was where I learned to defend a result under hard questioning and to admit when the data simply could not say.

Data Analyst — Caldecott Bridge Research Nov 2020 - May 2021
York, United Kingdom

Produced recurring performance reporting and ad-hoc analysis for an internal operations group. I automated several manual reports that had eaten a day each week and built the first shared definitions for the metrics everyone had been calculating differently. The role gave me a strong grounding in data quality before I moved fully into modelling.

PROJECTS

Tenancy Yield Forecasting Platform

Acted as scrum master for a small cross-functional team building a forecasting tool for a commercial property portfolio. I ran the planning and review cadence, kept the backlog honest, and shielded the engineers from shifting requirements so the modelling work could land on time. The result was a single forecast view that the asset managers checked weekly.

Tech: .NET, Ruby

Itinerary Demand Modelling Engine

Led the data science work on a shared engine serving a property-development group and a set of travel-booking partners. I designed the feature pipeline and the evaluation harness so each partner could see how the model behaved on their own segment. The hardest part was reconciling very different data shapes into one consistent training set.

Tech: Delphi, Gitlab

EDUCATION

BSc in Mathematics and Statistics

2015 - 2019

Wexhall University, Leeds, United Kingdom
